

# Information about Proteolytic Enzym

**Acts as a supplement and helps to improve the uptake and efficacy of Protocol.**

## **Provider writes:**

Cells are covered with fibrin (a protein), the same as a scar tissue is made of. When the cells are pooled to form a tumor it creates a protective layer with fibrin. This thick protective coating is designed to prevent the body's own defenses (natural killer cells, white blood cells or oxygen) from entering the cells/tumors and destroying them. Enzymes travels freely through the blood in the body and eat fibrin which protects cells/tumors. This will help Protocol access the cells easier. Enzymes also help with digestion and bowel function.

*The enzymes that are described are not clinically tested in Sweden.  
The information provided is not intended as medical counseling.  
In Sweden enzymes are sold only as a dietary supplement.*
